WebKit Safari based browser coming to Nokia N800

Posted by [Dusan](#) on Friday, August 3rd, 2007 at 7:44 am under [Linux](#), [Nokia](#), [Applications](#)

Just when we've got [Mozilla browser engine](#), Sand-labs.org [announced](#) the OWB (Origyn Web Browser) - Webkit based browser is about to hit the Nokia N800. The built in Opera was just not good enough for handling complex JavaScripts (i.e. AJAX), but then again the current release of Mozilla engine is still buggy and I find my N800 crashing whenever more complex page is loading in the browser.

Safari based browser coming to NOKIA N800

Will Origyn Web Browser bring something new to the table? According to several sources around the web, WebKit, which is used in Apple's Safari is known to outperform other browsers on low powered machines. For instance, Nokia is using WebKit code for its S60 browser for years, and people love it!

At this stage, Sand-Labs is still working on bugs, but hopefully soon enough we'll have another browser available for N800, and... following the [keyboard](#) and [scrolling](#), we'll be one step closer to turn our N800s into iPhones... No, I don't want to do that! 😊
